cs628-pe-Neha_Arora

This project was bootstrapped with [Create React App](#).

Input

The program accepts user input in the form of tasks to be added to the todo list. The user types a task into the input field and clicks the "Add Task" button.

Process

When the user adds a task, the program processes the input by storing it in an array of tasks. The program also handles the deletion of tasks by filtering the array to exclude the deleted task.

Output

The program displays the list of tasks in the todo list. Each task is displayed with a delete button next to it. When a task is deleted, the program updates the display to reflect the new list of tasks.
